Computer-Based Data Processing

Project – Make Something with a Spreadsheet

The project

This is an **open-ended project**. The goal is to use LibreOffice Calc to design and create something that interests you, drawing on the concepts covered during the semester.

You do not have to carry out a conventional data analysis: a spreadsheet can also be used to build, simulate, organise, visualise, or even play.

A game Games of chance, quizzes, strategy games…	**A simulator** Epidemics, populations, economies…
A management tool Budgets, tournaments, collections…	**A data analysis** Sports, music, the environment…

Other ideas are welcome: animated pixel art, a generator, an interactive tool, a visualisation, a ranking system, a mathematical model, etc. **A simple, original idea that is well implemented is better than an overly ambitious project left unfinished.**

What is expected

Your project must make meaningful use of the spreadsheet. It should involve **several concepts covered during the semester**, chosen to suit your project:

- formulas, relative or absolute references, conditional logic;
- data processing and transformation;
- sorting, filtering, lookups, and relationships between tables;
- statistics, pivot tables, or charts;
- Goal Seek, Solver, or a simulation model;
- formatting that makes the result understandable and usable.

You do not have to use all these tools. Your choices should make sense in relation to your idea.

Submission

Your submission must include two items:

- the **Calc file** containing your project;
- a **document of no more than 2 pages** explaining your approach.

This document should provide a quick understanding of your project:

- the idea and purpose of the project;
- the approach you followed to create it;
- the main features or analyses implemented;
- the Calc tools used;
- the results obtained and, where relevant, their limitations.

You do not need to describe every formula or every step in detail: the document should provide a **clear overview of your approach and what you created**.

Assessment

Criterion	Importance
Quality and functionality of the project	+++
Appropriate use of spreadsheet tools	+++
Understanding and mastery of the project	+++
Clarity of the presentation	++
Creativity and initiative	++

Most importantly: choose an idea that makes you want to experiment. Your project does not have to be complicated to be successful.
